

# Mechanical Face Seals

**Your Partner for Sealing Technology**

## Your Partner for Sealing Technology

**Trelleborg Sealing Solutions** is a major international sealing force, uniquely placed to offer dedicated design and development from our market-leading product and material portfolio: a one-stop-shop providing the best in elastomer, thermoplastic, PTFE and composite technologies for applications in aerospace, industrial and automotive industries.

With 50 years of experience, **Trelleborg Sealing Solutions** engineers support customers with design, prototyping, production, test and installation using state-of-the-art design tools. An international network of over 70 facilities worldwide includes 30 manufacturing sites, strategically-positioned research and development centers, including materials and development laboratories and locations specializing in design and applications.

Developing and formulating materials in-house, we utilize the resource of our material database, including over 2,000 proprietary compounds and a range of unique products.

**Trelleborg Sealing Solutions** fulfills challenging service requirements, supplying standard parts in volume or a single custom-manufactured component, through our integrated logistical support, which effectively delivers over 40,000 sealing products to customers worldwide.

Facilities are certified to ISO 9001:2000 and ISO/TS 16949:2002. **Trelleborg Sealing Solutions** is backed by the experiences and resources of one of the world's foremost experts in polymer technology: the **Trelleborg Group**.

ISO 9001:2000

ISO/TS 16949:2002

The information in this brochure is intended to be for general reference purposes only and is not intended to be a specific recommendation for any individual application. The application limits for pressure, temperature, speed and media given are maximum values determined in laboratory conditions. In application, due to the interaction of operating parameters, maximum values may not be achieved. It is vital therefore, that customers satisfy themselves as to the suitability of product and material for each of their individual applications. Any reliance on information is therefore at the user's own risk. In no event will Trelleborg Sealing Solutions be liable for any loss, damage, claim or expense directly or indirectly arising or resulting from the use of any information provided in this brochure. While every effort is made to ensure the accuracy of information contained herewith, Trelleborg Sealing Solutions cannot warrant the accuracy or completeness of information.

**To obtain the best recommendation for a specific application, please contact your local Trelleborg Sealing Solutions marketing company.**

## ■ Description

**Mechanical Face Seals** are a special form of mechanical seals. They are also known under other designations, such as lifetime seals, floating seals, duo cone seals, toric seals and heavy duty seals.

### Types

There are two different types of **Mechanical Face Seals**: the most common form is Type DO, which is characterized by the use of an **O-Ring** as the secondary sealing element (Figure 1).

Type DF, on the other hand, has an elastomer with a diamond-shaped cross section as a secondary sealing element instead of the **O-Ring** (Figure 2).

Both types consist of two identical metal seal rings which seal against each other on a lapped seal face.

Special designs, like that in Figure 3, are available on request. Seal types can also be divided by the use of different seal materials (see page 4).

### Design Features

The seals consist of two metallic seal rings. They are mounted in separate housing face to face. The elastomeric elements center the seal in the housing.

There are two tapered cones in the housing and at the O.D. of the seal. The taper increases with the depth of the bore due to the different grade of the cones. The housing shape can normally be machined on a NC machine tool.

### Method of Operation

The **O-Ring** and the elastomeric washer provide three different functions:

- They generate a uniform axial face load because of their elasticity.
- They act as a static seal at the inner diameter and outer diameter.
- They prevent the seal ring from turning with the shaft and transmit the torque from the rotating half of the housing through the faces to the static half.

It is important to know that only one half of the seal rotates; the interface between the two precision lapped mating surfaces rotating against the other at right angles to the shaft. They form a leak-proofed seal.

The seal has a wedge shaped gap from the ID to the seal face allowing for easy access to lubricate the seal face. Lubrication is necessary at all times. The lubricant builds a thin film between the sliding faces by a capillary effect and centrifugal force.

The seal face is processed by grinding and lapping.

Figure 1 Mechanical Face Seals, Type DO

Figure 2 Mechanical Face Seals, Type DF

Figure 3 Special Design

### Advantages:

- Simple, reliable design
- High sealing effect against dirt, dust, water and abrasive media from the outside and against oil and grease from the inside
- Cost-effective
- Long service life
- Self-centering to compensate for shaft eccentricity or misalignment
- Maintenance-free
- Easy to assemble

### ■ Applications

Mechanical Face Seals are predominantly used for sealing the bearings in construction machinery or production plants operating under extreme arduous conditions and subject to severe wear.

These include:

- Tracked vehicles, such as excavators and bulldozers
- Conveyor systems
- Heavy trucks
- Axles
- Tunnel boring machines
- Agriculture machines
- Mining machines

Mechanical Face Seals are proven in general machine engineering for gearboxes, mixers, stirrers, wind-driven power stations and other applications with similar conditions or where maintenance-free lifetime time sealing is expected.

### Technical Data

The seals should not be subjected simultaneously to maximum pressure and maximum speed.

Operating Pressure:

The shaft seal is pressure-free under normal operating conditions.

Pressure loading up to max. 0.3 MPa (3 bar) for shell mold Cast Iron and 0.15 MPa (1.5 bar) for material 100Cr6 accepted. A higher static load up to 0.5 MPa (5 bar) is possible.

Internal pressure can lead to misalignment either of the seal or of the O-Ring.

Speed:

Cast Iron:	3 m/s with oil lubrication
100Cr6	2.2 m/s with oil lubrication

Figure 4 Speed as function of diameter and rpm

Temperature:

-40 °C to +200 °C (-40 °F to +392 °F), depending on the elastomer material.

Lubrication, Media:

The lubrication serves two important functions, therefore it is needed in all cases. It reduces the friction between the seal face and the mating faces, and it acts as a cooling agent for the complete shaft and housing.

The best results with regard to wear and service life are achieved with oil lubrication. Grease lubrication is possible but needs special attention. It can only be used for slower motion. It is sufficient if the oil level is 1/2 to 1/3 of the seal inside diameter. Specially recommended is transmission oil e.g. SAE 80 or SAE 90. In other cases a thinner lubricant can be useful like SAE oils 20W20 or 10W40. The oil level should be between the center line of the shaft and two thirds of seal diameter.

If environmentally compatible bio-oils are to be used, please contact us. In this case, the compatibility of the oil with the elastomer materials used must be tested.

## Materials

### Metal Parts

**Mechanical Face Seals** are available in two different steel grades.

The standard material used for the **Mechanical Face Seals** is a special shell mold Cast Iron. This material was developed specifically for the extreme operating conditions of the seals. The material is a high-alloy, corrosion-resistant Cast Iron. A natural hardness of 58 HRC is achieved directly after casting, which is increased to a minimum of 65 HRC by heat treatment.

The castings are then further processed by grinding, lapping and polishing. For material specifications, see Table I.

Alternatively a cheaper forged roller Bearing Steel (100CR6), material number 1.3505, can also be used. Seals made from this material are manufactured by copy turning followed by induction or salt bath hardening. The hardness is 58 to 63 HRC. The seal faces of these parts are also lapped and polished. For material specifications, see Table I.

**Table I Preferred Materials**

Material Chemical Composition %	Material No. 1.3505	Shell Mold Cast Iron
C	0.90 - 1.05	2.80 - 3.60
Si	0.15 - 0.35	1.00 - 1.60
Mn	0.25 - 0.45	0.40 - 1.00
P	< 0.03	< 0.04
S	< 0.025	< 0.04
Cr	1.40 - 1.65	16.00 - 19.00
Mo	—	2.00 - 4.00
Ni	< 0.30	—
Fe	balance	balance

### Elastomers

Depending on seal type the following standard elastomers are used:

- Type DO - alloy Cast Iron  
Acrylonitrile Butadiene Rubber (NBR)
- Type DO - Bearing Steel (1.3505)  
Acrylonitrile Butadiene Rubber (NBR)

For higher thermal loads or other parameters, different compounds can be supplied.

**Table II Alternative Compounds**

Compound	Hardness	Temperature range
HNBR	60-65 Shore A	-30 °C to 150 °C
FKM	60-65 Shore A	-20 °C to 200 °C
VQM	60-65 Shore A	-50 °C to 200 °C

Please contact your local Trelleborg Sealing Solutions marketing company.

**Table III NBR Compounds**

	Standard NBR Compounds	
Seal Type	Alloy Cast Iron seal	Bearing Steel Seals
Description	NBR	NBR
Hardness	60-65 Shore A	60-65 Shore A
Tensile strength	>12.0	>12.0
Elongation at break	>250	>280
Temperature range*	-30 °C to +100 °C (-22 °F to +212 °F)	-20 °C to +100 °C (-4 °F to +212 °F)

Maximum and minimum operating temperatures depend on specific application criteria and sealing medium.

### Corrosion Test

During operation, **Mechanical Face Seals** can be exposed not only to physical and thermal stresses, but also to extreme environmental stresses.

The behavior and resistance of the material to corrosion is a very important factor; e.g., in contact with seawater or in a maritime climate, when operating in salt plains or on exposure to salt spread on the roads in the winter. **Mechanical Face Seals** must also be able to withstand such conditions. The high-alloy shell mold cast material is particularly suitable to these environments. **Trelleborg Sealing Solutions** has demonstrated this under tough test conditions in salt water.

The surface of seals Bearing Steel 100Cr6 is not as resistant as the alloy materials even if with additional surface treatment a moderate corrosion resistance improvement is achieved.

## ■ Design Instructions

### Seal Housing

The installation dimensions of the seal housing are shown in Table IV and V.

A template can be used to check the housing geometry for Type DO.

The axial gap  $S$  in the housing is such that it meets the demands of the construction machinery industry.

For high sliding speeds it may be necessary to reduce the axial compression, thus reducing the load of the seal faces and the heat generation in the seal face. This is achieved by increasing the axial gap  $S$ .

The following gaps are possible (Table III), depending on the **O-Ring** cross section.

**Table IV Gaps**

O-Ring Cross-Section $d_1$	Gap $S_{max}$
$d_1 < 8.0$	4
$8 \leq d_1 \leq 12.7$	5
$d_1 > 12.7$	6

We recommend that tests be carried out to find the most appropriate setting.

Since the **O-Ring** is always oversized to the housing, the edges of the housing must be rounded.

### Surfaces

Under pressure, elastomers adapt themselves to irregular surfaces. However, for liquid-tight conditions, certain minimum requirements have to be made on the surface finish of the faces to be sealed.

Scores, scratches, pores and concentric or spiral machining scores are not permissible. For the surface of the seal installation chamber we recommend a machining quality of:

$R_a$	< 3.2 $\mu\text{m}$
$R_z$	< 10.0 $\mu\text{m}$
$R_{max}$	< 16.0 $\mu\text{m}$ .

### Shaft

The **Mechanical Face Seal** does not contact the shaft. For this reason, no particular demands have to be met on the hardness or surface finish.

To ensure correct operation a minimum gap must be maintained between the shaft and the inside diameter. This gap serves to supply the seal with lubricant. In order to dissipate the heat of friction, a good exchange of medium must be assured. Furthermore, tolerances, shaft deflections, etc. must be bridged by the gap.

Attention should be paid to the slight geometric deviation between the forged and the cast design. Figure 5 shows a bevel on the cast seal ring typical of the casting process. The forged version, on the other hand, has a cylindrical inner diameter (Figure 6).

Figure 5 Cast design with inclination at the inside diameter

Figure 6 Roller Bearing Steel design with smooth and cylindrical treatment at the inside diameter

## Installation Instructions

### Preparation for Installation

**Mechanical Face Seal** must be installed with great care. Damage to the precision lapped seal faces must be avoided at all costs. The installation location must be kept free from dust and dirt.

The installation should be carried out in the following steps.

### Preparation before Installation

- Remove the seal from its packing only immediately before installation.
- Do not stand the seal on the lapped surface.
- Coat the seal face with a thin film of oil using clean oil and a lint-free cloth, e.g. chamois leather.
- Check that the housing is free of nick or burr on installation radii.
- Check if **O-Ring** or washer is properly placed back on the seal. The **O-Ring** must be seated in the outer radius (Type DO) inside the retaining lip.

### Installation Instructions for the Type DO

- Make sure that the **O-Ring** is not twisted. A twisted **O-Ring** may cause a looped effect.
- Installation, particularly of large **O-Rings**, requires a great deal of force. We recommend that the **O-Ring** be coated with lubricant (soapy water, water/spirits mixture or an oil film) before installation.
- Assemble the two halves of the seal in the housing by using an installation tool. Center the **O-Ring** in the housing. Use two hands on the tool to press the seal into the housing with a firm push.
- Check if the tool is touching the housing all around the circumference.
- Remove the tool and make a visual check for position of **O-Ring** and seal. Make sure that everything is seated symmetrically.
- Clean both seal faces with denatured alcohol and apply a thin film of clean oil to the faces.
- Tilt the two parts together bringing the slide faces carefully into contact.
- Adjust the gap S.
- Fill the housing with oil and bleed, if necessary.

Figure 7 Fitting Tool

In the event that the installation tool cannot be withdrawn or where the seal is of a special design, an installation **O-Ring** can be used. The installation **O-Ring** is placed between the **O-Ring** of the seal and rear of the ramp on the Seal Ring. As force is applied to the Seal Ring during installation, the installation **O-Ring** backs up the **O-Ring** and will not allow it to roll up the ramp. After installation the **O-Ring** is easily removed- (see Figure 8).

Figure 8 O-Ring as installation aid

## Ordering Example

Mechanical Face Seal Type DO in Bearing Steel

Inside diameter D<sub>i</sub> = 125.0 mm

Materials: Seal rings of Bearing Steel (1.3505)  
O-Rings of NBR

TSS Article No.	TLDOA1250 - 2CP00
TSS Part No.	
Inside Ø x 10	
Quality Index (Standard)	
Material No.	

Dimensions and Part-Number see Table V, page 7.  
Materials see page 4.

## Mechanical Face Seals

### Ordering Example

Mechanical Face Seal Type DO in Cast Iron

Inside diameter Di = 115.0 mm

Materials: Seal rings of Cast Iron  
O-Rings of NBR

TSS Article No.	TLDOA1150	-	2FP00
TSS Part No.			
Inside Ø x 10			
Quality Index (Standard)			
Material No.			

Dimensions and Part Number see Table VI, page 12.  
Materials see page 4.

### Ordering Example

Mechanical Face Seal Type DF in Bearing Steel

Inside diameter: Di = 150 mm

Material: Sealing ring of Bearing Steel  
Square ring of NBR

Dimensions and Part Number see Table VII, page 15.  
Materials see page 4.
